

8. Project Demonstration Phase

8.1 Purpose of this phase

The demonstration shows stakeholders the working solution and proves that it meets the objectives set at the start. It is also an opportunity to gather final feedback and confirm readiness for release.

8.2 Demonstration objectives

- Show the business problem and how the solution solves it.
- Walk through the request-to-delivery lifecycle end to end.
- Show approval, rejection and exception behaviour.
- Present the benefits and measurable improvements.
- Collect feedback and agree next steps.

8.3 Audience

Project sponsor, IT management, process owner, helpdesk and procurement representatives, managers who approve requests and representative end users.

8.4 Preparation checklist

Item	Status to confirm
Instance is accessible and stable	Yes / No
Update set applied and flow activated	Yes / No
Demo users and passwords ready (requester, manager, procurement, IT)	Yes / No
Notifications visible (email logs or inbox)	Yes / No
Sample data cleaned so the demo is clear	Yes / No
Screenshots and slides ready as backup	Yes / No
Timing rehearsed	Yes / No

8.5 Suggested agenda (approximately 20 minutes)

Time	Segment
2 min	Introduction: the problem and the goal
2 min	The old process versus the new process
8 min	Live demonstration of the happy path
3 min	Rejection and fallback scenarios
2 min	Reports and dashboard
3 min	Benefits, limitations, future work, questions

8.6 Demonstration script

Scene 1: The problem (slides). Show the manual email process and its pain points: delays, missing information, no visibility.

Scene 2: Request submission (requester).

1. Log in as the requester and open the Service Portal.

2. Open the Standard Laptop Request item and complete the form.
3. Point out mandatory fields and the date validation, then submit.
4. Show the request number and the confirmation.

Scene 3: Automation starts (administrator view).

1. Open the RITM and show its state as *Awaiting Approval*.
2. Open the Flow Designer **Execution details** to show the flow triggered automatically and which action it is waiting on.

Scene 4: Approval (manager).

1. Log in as the manager, open **My Approvals** and review the request details.
2. Approve the request.
3. Show that the flow moved on immediately.

Scene 5: Procurement and fulfilment.

1. Show the procurement task created and assigned to the Procurement Team, with all required details.
2. Close the procurement task; show the IT setup task appear automatically.
3. Close the IT task and show the RITM change to *Closed Complete*.

Scene 6: Notifications. Display the emails received at each stage: submission, approval, completion.

Scene 7: Rejection path. Submit a second request, reject it with a reason and show the requester notification and the closed-incomplete state.

Scene 8: Exception handling. Submit a request for a user without a manager and show the fallback approver receiving the approval.

Scene 9: Reports. Show the dashboard for volume, approval time, fulfilment time and rejection rate.

8.7 Key points to emphasize

- No manual forwarding, no lost approvals.
- Every step has an owner, a timestamp and a record.
- The requester always knows where the request stands.
- The solution is low-code and can be modified by administrators without heavy development.
- The pattern is reusable for other hardware and software requests.

8.8 Before-and-after comparison

Aspect	Before	After
Request intake	Email, chat, phone	Single catalog form
Information quality	Frequently incomplete	Mandatory, structured fields
Approval	Email chasing	Automatic request with reminders
Procurement trigger	Manual	Automatic on approval
Status visibility	Ask the helpdesk	Portal and notifications
Audit trail	Scattered	Complete in the platform
Reporting	Not available	Dashboard

8.9 Handling questions

Likely questions and suggested answers:

- *What if the manager is unavailable?* The fallback approver and reminder logic handle this.

- *Can we order a non-standard laptop?* Not in this release; it is listed as a future enhancement.
- *How do we change the laptop models?* An administrator edits the model choices on the catalog item.
- *Can we add finance approval?* Yes, by adding a conditional approval step based on cost.
- *What if the flow fails?* The error is captured, the administrator is notified and the execution log shows exactly where it stopped.

8.10 Feedback collection

At the end of the demonstration, participants provide feedback on clarity of the form, usefulness of notifications, completeness of task details and any additional needs. Feedback is recorded and prioritized for the next release.

8.11 Demonstration success criteria

- The full lifecycle runs live without manual intervention beyond the human steps (approval and task completion).
- Rejection and fallback scenarios behave as designed.
- Stakeholders confirm the solution meets their needs and agree on go-live or the next steps.

8.12 Conclusion

Automating standard laptop orders with Flow Designer replaces a slow, email-driven process with a structured, visible and auditable workflow. Requesters get a simple form and clear status; managers approve with a click; procurement and IT receive complete, timely tasks; and management gains data to measure and improve service. The project demonstrates how ServiceNow's low-code capabilities can deliver rapid, practical value in IT procurement, and it provides a foundation that can be extended to other request types, cost-based approvals and vendor or ERP integration.
