

PHASE

Project Demonstration Phase

Date	28 September 2026
Team ID	SWTID-2026-5127
Project name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum marks	4

7. Project Documentation Phase

7.1 Purpose of this phase

Documentation captures what was built, why, and how to use, operate and maintain it. Without it, knowledge remains with the builder and the solution becomes hard to support or extend. This phase produces a documentation set for each audience: business users, administrators, testers and management.

7.2 Documentation set

Document	Audience	Content
Project overview / charter	Management, sponsors	Problem, objectives, scope, benefits
Requirements document	Analysts, testers	Functional and non-functional requirements, acceptance criteria
Design document	Developers, admins	Architecture, catalog design, flow design, states, security
User guide	Requesters, managers	How to request a laptop, track it and approve or reject
Fulfilment guide	Procurement and IT teams	How to handle assigned tasks and close them correctly
Administrator guide	Catalog and flow admins	How to maintain the flow, troubleshoot and change configuration
Test document	QA, project team	Test plan, cases, results and defects
Release notes / update set record	Release managers	What is included, version and deployment steps

7.3 User guide content (requester and manager)

How to request a laptop

1. Log in to the Service Portal.
2. Search for or browse to **Hardware > Standard Laptop Request**.
3. Select the person the laptop is for (defaults to you).
4. Choose the laptop model from the approved list.
5. Enter the justification, delivery location, needed-by date and cost center.
6. Click **Submit** and note your request number.

How to track a request

- Open **My Requests** in the portal to see the state, approval outcome and task progress.
- Email updates are sent when the request is approved, rejected and completed.

How to approve or reject (managers)

1. Open the approval email or go to **My Approvals** in the portal.
2. Review the request details and justification.
3. Click **Approve** or **Reject**. When rejecting, provide a reason.

7.4 Fulfilment guide content

- Procurement team: open the assigned catalog task, place the order as per model and cost center, add order/PO details in the work notes, and close the task on confirmation of the order/delivery.
- IT fulfilment team: image and configure the laptop, install standard software, record the asset details, deliver to the user and close the task with completion notes.

7.5 Administrator guide content

Topic	Guidance
Changing laptop models	Update the select box choices (or model records) in the catalog item variable
Changing the approver rule	Edit the Ask for Approval action or the approval subflow
Changing groups	Update the group in the task creation actions/subflow
Adjusting reminder timing	Edit the Wait duration and reminder condition
Troubleshooting a stuck request	Open the flow Execution details for the RITM, identify the failing or waiting action, correct data or re-run
Notification issues	Check the Email Logs and notification conditions
Version control	Save flow versions; publish changes through update sets

7.6 Technical documentation

Components list

Type	Name
Catalog item	Standard Laptop Request
Flow	Standard Laptop Order Automation
Subflows	Manager Approval with Fallback; Create Fulfilment Task
Groups	Procurement Team; IT Fulfilment Team
Notifications	Submission, approval, rejection, reminder, completion
Client scripts	Cost center population; date validation
Reports	Volume, approval time, fulfilment time, rejection rate
Packaging	Update set "Laptop Order Automation v1.0"

Process summary: The requester submits the catalog item; the flow finds the approver, requests approval, creates a procurement task on approval, waits for its completion, creates an IT setup task, waits for its completion, and closes the RITM; rejection closes the request with the reason.

7.7 Traceability matrix

Requirement	Design element	Test case
FR-01, FR-02, FR-03	Catalog item and variables	TC-01, TC-02, TC-10
FR-04, FR-05	Service Catalog trigger	TC-03
FR-06	Ask for Approval action	TC-03, TC-08
FR-07	Create Catalog Task (Procurement)	TC-04
FR-08	Rejection branch	TC-05
FR-09	Notifications	TC-04, TC-05, TC-07
FR-10, FR-11	IT setup task and RITM updates	TC-06, TC-07
FR-12	Reminder logic	TC-09
FR-13	Reports and dashboard	TC-13

7.8 Change log and version history

Version	Date	Description	Author
0.1		Initial catalog item and variables	
0.5		Main flow with approval and tasks	
0.9		Reminders, rejection handling, notifications	
1.0		Tested and approved release	

7.9 Known limitations

- Supports standard laptop models only; custom specifications require a separate process.
- No direct integration with vendors or ERP for automatic purchase orders.
- Approval is limited to the direct manager (with fallback); multi-level approvals based on cost are not included in this release.

7.10 Future enhancements

1. Cost-based approval levels (for example, finance approval above a threshold).
2. Integration with vendor catalogs or an ERP for automatic purchase orders.
3. Automatic asset record creation and assignment on delivery.
4. Extending the pattern to monitors, mobile devices and software licences.
5. Virtual agent or chatbot ordering.
6. Onboarding integration: automatically raise the laptop request when a new hire record is created.
7. Requester satisfaction survey after completion.

7.11 Maintenance and support

- Assign a flow owner responsible for changes and periodic review.
- Review execution logs and errors on a regular schedule.
- Review the approved model list every quarter.
- Keep user, manager and group data accurate.
- Re-test after platform upgrades.

7.12 Documentation standards

- Version-controlled documents with author and date.
- Screenshots of the catalog form, the flow canvas, the approval, tasks and notifications.
- Plain language for user-facing documents; technical detail confined to admin and design documents.

7.13 Outcome of the phase

A complete, versioned documentation set that lets users work confidently, lets administrators support the solution, and lets the organization extend it in future.
